We have a list of useful code snippets for you. Simply use them for your application. All snippets are free to use and licensed under Apache 2.0.

Test DBStorages without Lifecycle objects

Access a DBStorage without JVx Server, Lifecycle Object, Security e.g. for Unit tests

ContactsAutoFrame.java

```
//configure DB access
DBAccess dba = new DBAccess();
dba.setUrl("...");
dba.setUsername("user");
dba.setPassword("pwd");
dba.open();

//configure storage for Table USERS
DBStorage dbs = new DBStorage();
dbs.setFromClause("USERS");
dbs.setDBAccess(dba);
dbs.open();

//direct object connection for direct method calls
DirectObjectConnection con = new DirectObjectConnection();
con.put("users", dbs);

//client connection for RemoteDataBook access to the storage
MasterConnection macon = new MasterConnection(con);
macon.open();

RemoteDataSource rds = new RemoteDataSource(macon);
rds.open();

RemoteDataBook rdbApps = new RemoteDataBook();
rdbApps.setDataSource(rds);
rdbApps.setName("users");
rdbApps.open();
```

A custom Application without menu, toolbar, ...

Sometimes we need an application without overhead, e.g for Vaadin UI.

SimpleApplication.java

```
public class SimpleApplication extends Application
                               implements IExceptionListener
{
   //~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
```

```
// Class members
//~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

/** the main/content panel. */
private UIPanel panMain;

//~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
// Initialization
//~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

/**
 * Creates a new instance of <code>SimpleApplication</code>.
 *
 * @param pLauncher the launcher
 */
public SimpleApplication(UILauncher pLauncher)
{
   super(pLauncher);

   setName("Simple application");

   init();
}

/**
 * Initializes the application.
 */
private void init()
{
   ExceptionHandler.addExceptionListener(this);

   panMain = new UIPanel();
   panMain.setLayout(new UIBorderLayout());

   panMain.add(YOUR COMPONENT, UIBorderLayout.CENTER);

   setLayout(new UIBorderLayout());
   add(panMain);
}

//~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
// Interface implementation
//~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

public IContainer getContentPane()
{
   return panMain;
}

public <OP> IContent showMessage(OP pOpener,
                                 int pIconType,
```

```
                                    int pButtonType,
                                    String pMessage,
                                    String pOkAction,
                                    String pCancelAction) throws
Throwable
   {
      System.out.println(pMessage);

      return null;
   }

   public void handleException(Throwable pThrowable)
   {
      System.out.println(CommonUtil.dump(pThrowable, false));
   }

}   // SimpleApplication
```

Test your business logic with JUnit

Tests our business logic without an application server, but with our Lifecycle objects. We test our server code without specific configuration or modifications for unit tests.

Business Object:

UserRegistration.java

```
public class UserRegistration
{
   /**
    * Removes/Unregisters a user and all its content.
    *
    * @param pUserName the user name
    * @throws Exception if the user can not be deleted
    */
   public void delete(String pUserName) throws Exception
   {
      try
      {
         DBAccess dba =
(DBAccess)SessionContext.getCurrentSession().get("newDBAccess");

         DBStorage dbsUser = new DBStorage();
         dbsUser.setDBAccess(dba);
         dbsUser.setWritebackTable("USERS");
         dbsUser.open();

         List<IBean> liBeans = dbsUser.fetchBean(new Equals("USERNAME",
```

```
                                                                pUserName),
null, 0, -1);

         //the username is unique and it's not possible that a user
exists
         //more than once!
         if (liBeans.size() == 1)
         {
            //delete the user (db will cascade all user-data)
            dbsUser.delete(liBeans.get(0));
         }
         else
         {
            throw new SecurityException("User '" + pUserName + "' was
not found!");
         }
      }
      catch (Throwable th)
      {
         throw new SecurityException("It's not possible to delete the
user!", th);
      }
   }
}   // UserRegistration
```

A standard Lifecycle Object:

Session.java

```
public class Session extends GenericBean
{
   //~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
   // User-defined methods
   //~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

   /**
    * Creates a new database access object.
    *
    * @return the new database access object
    * @throws Exception if the connection can not be opened
    */
   public DBAccess getNewDBAccess() throws Exception
   {
      DBAccess dba =
DBAccess.getDBAccess(DBSecurityManager.getCredentials(
SessionContext.getCurrentSessionConfig()));
      dba.open();

      return dba;
   }
```

```
   /**
    * Returns the access to the database.
    *
    * @return the access to the database
    * @throws Exception if the datasource can not be opened
    */
   public DBAccess getDBAccess() throws Exception
   {
      DBAccess dba = (DBAccess)get("dBAccess");

      if (dba == null)
      {
         dba = getNewDBAccess();

         put("dBAccess", dba);
      }

      return dba;
   }

   /**
    * Gets the user registration business object.
    *
    * @return the business object for user registrations
    */
   public UserRegistration getRegistration()
   {
      UserRegistration ureg = (UserRegistration)get("registration");

      if (ureg == null)
      {
         ureg = new UserRegistration();

         put("registration", ureg);
      }

      return ureg;
   }

}    // Session
```

Unit Test:

```
/**
 * Tests the our delete method from the user registration object.
 *
 * @throws Throwable if the test fails
 */
@Test
```

```
public void testDelete() throws Throwable
{
   AbstractConnection con = createConnection(null);

   try
   {
      //delete user with the name "unknownuser"
      con.call("registration", "delete", "unknownuser");

      Assert.fail("User 'unknownuser' found!");
   }
   catch (SecurityException se)
   {
      Assert.assertEquals("User 'unknownuser' was not found!",
                          se.getMessage());
   }

   con.close();
}

/**
 * Creates a new connection.
 *
 * @param pConProps additional connection properties
 * @return the connection
 * @throws Throwable if the connection can not be opened
 */
private AbstractConnection createConnection(Hashtable<String, String>
pConProps) throws Throwable
{
   MasterConnection macon = new MasterConnection(new
DirectServerConnection());
   macon.setApplicationName("app");
   macon.setUserName("user");
   macon.setPassword("pwd");

   if (pConProps != null)
   {
      for (Map.Entry<String, String> entry : pConProps.entrySet())
      {
         macon.setProperty(entry.getKey(), entry.getValue());
      }
   }

   macon.open();

   return macon;
}
```

A very simple AbstractMemStorage implementation

A server side memory storage with the column names: ID, NAME, PATH. The column PATH is not visible on the client-side, but is important for server-side. If “error” is set as NAME, an Exception is thrown!

SimpleMemStorage.java

```
public class SimpleMemStorage extends AbstractMemStorage
{
   //~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
   // Abstract methods implementation
   //~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

   /**
    * {@inheritDoc}
    */
   @Override
   public RowDefinition getRowDefinition() throws ModelException
   {
      RowDefinition rowdef = new RowDefinition();
      rowdef.addColumnDefinition(new ColumnDefinition("ID", new
BigDecimalDataType()));
      rowdef.addColumnDefinition(new ColumnDefinition("NAME", new
StringDataType()));
      rowdef.addColumnDefinition(new ColumnDefinition("PATH", new
StringDataType()));

      rowdef.setPrimaryKeyColumnNames(new String[] {"ID"});

      rowdef.setColumnView(null, new ColumnView("ID", "NAME"));

      return rowdef;
   }

   /**
    * {@inheritDoc}
    */
   @Override
   public void loadData(MemDataBook pBook, ICondition pFilter) throws
ModelException
   {
      pBook.deleteAllDataRows();

      pBook.insert(false);
      pBook.setValues(new String[] {"ID", "NAME", "PATH"},
                      new Object[] {BigDecimal.valueOf(0), "First",
"/home/first"});
      pBook.insert(false);
      pBook.setValues(new String[] {"ID", "NAME", "PATH"},
```

```
                        new Object[] {BigDecimal.valueOf(1), "Second",
"/home/second"});
      pBook.insert(false);
      pBook.setValues(new String[] {"ID", "NAME", "PATH"},
                        new Object[] {BigDecimal.valueOf(2), "Third",
"/home/third"});
   }

   /**
    * {@inheritDoc}
    */
   @Override
   public void insert(DataBookEvent pEvent) throws ModelException
   {
      if
("error".equals(pEvent.getChangedDataBook().getValueAsString("NAME")))
      {
         throw new ModelException("not allowed");
      }
   }

   @Override
   public void delete(DataBookEvent pEvent)
   {
   }

   @Override
   public void update(DataBookEvent pEvent) throws ModelException
   {
      if
("error".equals(pEvent.getChangedDataBook().getValueAsString("NAME")))
      {
         throw new ModelException("not allowed");
      }
   }

}   // SimpleMemStorage
```

Change XML files very fast

Our XML file

```
<server>
  <!-- Test: STARTPORT -->
  <startport>2001</startport>

  <audio>off</audio>
  <serial>COM1</serial>
```

```
  <domain>JVx</domain>
</server>
```

Change it:

```
XmlNode xmnRead = readXml("simple.xml");

xmnRead.setNode("/server/audio", null);
xmnRead.setNode("/server/domain", "www.sibvisions.com");

writeXml(xmnRead, "simple.xml");
```

EventHandler without Listener interface

Event definition:

```
/** the event handler for captured (the event has one parameter: byte[]). */
private CallableHandler chCaptured = new CallableHandler(byte[].class);

/** the event handler for canceled (the event has no parameter). */
private CallableHandler chCanceled = new CallableHandler();
```

Event access:

```
/**
 * Gets the captured event handler.
 *
 * @return the event handler
 */
public CallableHandler eventCaptured()
{
   return chCaptured;
}

/**
 * Gets the canceled event handler.
 *
 * @return the event handler
 */
public CallableHandler eventCanceled()
{
   return chCanceled;
}
```

Dispatch events:

```
chCaptured.dispatchEvent(byData);
chCancel.dispatchEvent();
```

Listener registration:

```
object.eventCaptured().addListener(this, "doCapture");

public void doCapture(byte[] pImage) throws Exception
{
    //...
}
```

EventHandler with Listener interface

The interface:

IRemoteApplicationListener.java

```
public interface IRemoteApplicationListener
{
   //~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
   // Method definitions
   //~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

    /**
     * Invoked when login was successful.
     *
     * @param pApplication the application
     */
    public void afterLogin(RemoteApplication pApplication);

    /**
     * Invoked when logout was successful.
     *
     * @param pApplication the application
     */
    public void afterLogout(RemoteApplication pApplication);

}   // IRemoteApplicationListener
```

The EventHandler:

RemoteApplicationHandler.java

```
public class RemoteApplicationHandler extends
RuntimeEventHandler<IRemoteApplicationListener>
{
   //~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
   // Initialization
   //~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
```

```
   /**
    * Constructs a new RemoteApplicationHandler.
    *
    * @param pListenerMethodName the method to be called inside the
interface.
    */
   public RemoteApplicationHandler(String pListenerMethodName)
   {
      super(IRemoteApplicationListener.class, pListenerMethodName);
   }

}   // RemoteApplicationHandler
```

Event access:

```
/** the "after login" event. */
private RemoteApplicationHandler eventAfterLogin;

/** the "after logout" event. */
private RemoteApplicationHandler eventAfterLogout;

/**
 * Gets the event handler for the after login event.
 *
 * @return the event handler
 */
public RemoteApplicationHandler eventAfterLogin()
{
   if (eventAfterLogin == null)
   {
      eventAfterLogin = new RemoteApplicationHandler("afterLogin");
   }
   return eventAfterLogin;
}

/**
 * Gets the event handler for the after logout event.
 *
 * @return the event handler
 */
public RemoteApplicationHandler eventAfterLogout()
{
   if (eventAfterLogout == null)
   {
      eventAfterLogout = new RemoteApplicationHandler("afterLogout");
   }
   return eventAfterLogout;
}
```

Dispatch Events:

```
/**
 * Fires the after logout event.
 */
protected void afterLogout()
{
   if (eventAfterLogout != null)
   {
      eventAfterLogout.dispatchEvent(this);
   }
}

/**
 * Fires the after login event.
 */
protected void afterLogin()
{
   if (eventAfterLogin != null)
   {
      eventAfterLogin.dispatchEvent(this);
   }
}
```

Listener registration:

```
app.eventAfterLogin().addListener(this, "doAfterLogin");
app.eventAfterLogout().addListener(this, "doAfterLogout");

//We do not need the parameter
public void doAfterLogin()
{
}

//We do not need the parameter
public void doAfterLogout()
{
}
```

A Custom AccessController

Create a custom AccessController implementation, e.g.:

AppAccessController.java

```
package com.sibvisions.apps.test;

import ...
```

```
public class AppAccessController implements IAccessController
{
   /** the allowed lifecycle objects. */
   private ArrayUtil<String> auAllowedLCO = null;

   /**
    * {@inheritDoc}
    */
   public boolean isAllowed(String pLifecycleName)
   {
      //all explicite allowed lifecycle objects are accessible
      if (auAllowedLCO != null)
      {
         return auAllowedLCO.contains(pLifecycleName);
      }

      return false;
   }

   /**
    * {@inheritDoc}
    */
   public void addAccess(String pLifecycleName)
   {
      if (pLifecycleName == null)
      {
         return;
      }

      if (auAllowedLCO == null)
      {
         auAllowedLCO = new ArrayUtil<String>();
      }

      if (!auAllowedLCO.contains(pLifecycleName))
      {
         auAllowedLCO.add(pLifecycleName);
      }
   }
}
```

Configure the application:

config.xml

```
<?xml version="1.0" encoding="UTF-8"?>

<application>
  <securitymanager>
    <class>com.sibvisions.rad.server.security.DBSecurityManager</class>
```

```
<accesscontroller>com.sibvisions.apps.test.AppAccessController</accessc
ontroller>
  </securitymanager>

  <datasource>
    <db name="default">
      <driver>org.hsqldb.jdbcDriver</driver>
      <url>jdbc:hsqldb:hsql://localhost/demodb</url>
      <username>sa</username>
      <password></password>
    </db>
  </datasource>
</application>
```

Remote calls to JVx without UI

JVx is a full stack application framework, but all parts are independent. It is no problem to use only the communication classes or the Swing controls without GenUI. This snippet shows how it is possible to use JVx only on server side. You have full session handling and the client is built with your preferred UI or you client has no UI.

Use JVx on server-side as usual. Integrate it into an application server like Tomcat or use it standalone.

Use the communcation classes to access server objects and actions. A simple object call could be implemented like the following snippet.

Get the source code for a specific class via Server Object:

```
HttpConnection httpcon = new
HttpConnection("http://demo.sibvisions.org/showcase/services/Server");

MasterConnection macon = new MasterConnection(httpcon);
macon.setApplicationName("showcase");
macon.setUserName("admin");
macon.setPassword("admin");
macon.open();

macon.call("sourceCode", "get",
"com.sibvisions.apps.showcase.frames.ChartFrame");
```

Get data from the database:

```
SubConnection subcon =
macon.createSubConnection("com.sibvisions.apps.showcase.frames.Contacts");
subcon.open();

RemoteDataSource dataSource = new RemoteDataSource();
dataSource.setConnection(subcon);
```

```
dataSource.open();

RemoteDataBook rdbContacts = new RemoteDataBook();
rdbContacts.setDataSource(dataSource);
rdbContacts.setName("contacts");
rdbContacts.open();

rdbContacts.fetchAll();
```

Use rdbContacts to insert/update/delete records.

Use JVx Swing controls without JVx UI

JVx's Swing controls are independent of JVx UI. It is no problem to use a table that shows some database or in-memory records. It is also possible to use 3-tier or 2-tier architecture.

In-Memory data

Use JVxTable and integrate it in your Swing application. Use it like a standard JTable.

JVxTableTest.java

```
public class JVxTableTest extends JFrame
{
   public static void main(String[] pArgs) throws Throwable
   {
      new JVxTableTest();
   }

   JVxTableTest() throws Throwable
   {
      //--------------------------------
      // Data
      //--------------------------------

      MemDataBook mdbData = new MemDataBook();
      mdbData.setName("person");
      mdbData.getRowDefinition().addColumnDefinition(new
ColumnDefinition("FIRSTNAME"));
      mdbData.getRowDefinition().addColumnDefinition(new
ColumnDefinition("LASTNAME"));
      mdbData.getRowDefinition().addColumnDefinition(new
ColumnDefinition("PHONE"));
      mdbData.open();

      mdbData.insert(true);
      mdbData.setValues(new String[] {"FIRSTNAME", "LASTNAME",
"PHONE"},
```

```
                        new String[] {"JVx", "rocks", "+43 000 / 1234
567"});

      mdbData.saveAllRows();

      //---------------------------------
      // Swing
      //---------------------------------

      JVxTable table = new JVxTable();
      table.setDataBook(mdbData);

      setLayout(new BorderLayout());

      add(table, BorderLayout.CENTER);

      setPreferredSize(new Dimension(500, 400));
      pack();
      setDefaultCloseOperation(JFrame.EXIT_ON_CLOSE);
      setVisible(true);
   }

}   // JVxTableTest
```

You have all JVx features like link cell editors, image choice editors - in your Swing application!

2-tier data (database)

Replace the MemDataBook with following code:

```
//---------------------------------
// Database handling
//---------------------------------

//DB Connection
DBAccess dba = DBAccess.getDBAccess("jdbc:hsqldb:hsql://localhost/db");
dba.setUsername("sa");
dba.setPassword("");
dba.open();

//Table access
DBStorage dsFiles = dba.createStorage();
dsFiles.setWritebackTable("FILES");
dsFiles.setAutoLinkReference(false);
dsFiles.open();

//---------------------------------
// Communication
```

```
//--------------------------------

//Connection handling
DirectObjectConnection con = new DirectObjectConnection();
con.put("files", dsFiles);

MasterConnection macon = new MasterConnection(con);
macon.open();

//Connect to the "remote" table
RemoteDataSource rds = new RemoteDataSource(macon);
rds.open();

RemoteDataBook rdbData = new RemoteDataBook();
rdbData.setDataSource(rds);
rdbData.setName("files");
rdbData.open();
```

3-tier data (database)

Remote DBAccess, DBStorage and DirectObjectConnection and replace the MasterConnection with following code:

```
HttpConnection con = new
HttpConnection("http://server/app/services/Server");

MasterConnection macon = new MasterConnection(con);
macon.setApplicationName("showcase");
macon.setUserName("admin");
macon.setPassword("admin");
macon.open();
```

Example for automatic link cell editors

The client code:

ContactsAutoFrame.java

```

      ,(SELECT I.HEALTH_INSURANCE FROM HEALTHINSURANCES I WHERE I.ID =
C.HEIN_ID) HEALTH_INSURANCE
      ,C.FILENAME
      ,C.IMAGE
  FROM CONTACTS C

CREATE VIEW V_CONT_EDUC AS
SELECT CE.ID
      ,CE.CONT_ID
      ,CE.EDUC_ID
      ,(SELECT E.EDUCATION FROM EDUCATIONS E WHERE E.ID = CE.EDUC_ID)
EDUCATION
  FROM CONT_EDUC CE
```

Encrypt passwords

We don't encrypt passwords on client-side and not in the database. We use our middleware for that. It's super easy with server-side triggers/events:

Add the method:

```
/**
 * Encrypts a password, if password is changed.
 *
 * @param pEvent the storage event
 * @throws Exception if encryption or data change fails
 */
public void doEncryptPwd(StorageEvent pEvent) throws Exception
{
   IBean bn = pEvent.getNew();

   String sNew = (String)bn.get("PASSWORD");
   String sOld;

   IBean bnOld = pEvent.getOld();

   if (bnOld != null)
   {
      sOld = (String)bnOld.get("PASSWORD");
   }
```

```
   else
   {
      sOld = null;
   }

   if (!CommonUtil.equals(sOld, sNew))
   {
      //use the configuration of the selected application!
      bn.put("PASSWORD", AbstractSecurityManager.getEncryptedPassword(
                           SessionContext.getCurrentSession().getConfig(),
sNew));
   }
}
```

to your life-cycle object e.g. Session.java.

Add an event to your storage

```
//example storage
dbsUser = new DBStorage();
dbsUser.setDBAccess(getDBAccess());
dbsUser.setFromClause("USER");
dbsUser.open();

dbsUser.eventBeforeInsert().addListener(this, "doEncryptPwd");
dbsUser.eventBeforeUpdate().addListener(this, "doEncryptPwd");
```

As last step, you need the password algorithm in your config.xml:

```
<?xml version="1.0" encoding="UTF-8"?>

<application>
  <securitymanager>
    <passwordalgorithm>SHA</passwordalgorithm>
  </securitymanager>
  ...
</application>
```

Choose one of the following algorithm: MD2, MD4, MD5, SHA, SHA-256, SHA-384, SHA-512.

Fetch data with DBStorage

Sometimes you want to use DBAccess and DBStorage without JVx server and life-cycle objects. This is very easy because JVx was designed as library. Simply use DBStorage and DBAccess in your Servlets, applications, ...

The following example uses DBAccess and DBStorage to check if a user exists in the database and if an email address doesn't exist.

```
dba = DBAccess.getDBAccess("jdbc:oracle:thin:@localhost:1521:xe");
```

```
dba.setUsername("user");
dba.setPassword("password");
//also possible, but needs rad/apps/myapp/config.xml
//DBAccess dba = DBAccess.getDBAccess(DBSecurityManager.getCredentials(
//
Configuration.getApplicationZone("myapp").getConfig()));
dba.open();
dba.getConnection().setAutoCommit(false);

DBStorage dbsUser = new DBStorage();
dbsUser.setDBAccess(dba);
dbsUser.setWritebackTable("USERS");
dbsUser.open();
```

If you prefer POJOs:

```
User user = dbsUser.createPOJO(User.class, bnUser);
```

50% width with FormLayout

If you have two components, e.g. GroupPanels and if you want that each group is 50% of the parent width, you could use following code:

```
UIFormLayout layout = new UIFormLayout();

IConstraints center = layout.getHCenterConstraints(0, 5, -1, 5);

UILabel label = new UILabel();
label.setPreferredSize(5, 0);

panel.add(label, center);
panel.add(gpanLeft, layout.getConstraints(center.getTopAnchor(),
layout.createAnchor(layout.getLeftMarginAnchor(), 0),
                                  center.getBottomAnchor(),
                                  layout.createAnchor(center.getLeftAnchor(),
0)));
panel.add(gpanRight, layout.getConstraints(center.getTopAnchor(),
layout.createAnchor(center.getRightAnchor(), 0),
                                  center.getBottomAnchor(),
layout.createAnchor(layout.getRightMarginAnchor(), 0)));
```

Search column in condition

If you create your own IStorage impelementation, it could be useful to know how to find the value for a specific column:

```
public static Object getEqualsValue(ICondition pFilter, String pColumn)
{
```

```
        if (pFilter instanceof OperatorCondition)
        {
                for (ICondition cond :
((OperatorCondition)pFilter).getConditions())
                {
                        if (cond instanceof Equals)
                        {
                                if
(pColumn.equals(((Equals)cond).getColumnName()))
                                {
                                        return ((Equals)cond).getValue();
                                }
                        }
                }
        }
        else if (pFilter instanceof Equals)
        {
                if (pColumn.equals(((Equals)pFilter).getColumnName()))
                {
                        return ((Equals)pFilter).getValue();
                }
        }

        return null;
}
```

Above method tries to find the first Equals condition with the given column name.

The method doesn't work with recursion because usually this is not necessary. If you want to know the different condition types, simply check `toString()` of `javax.rad.model.condition.BaseCondition`.

Connection property changed listener

It's easy to listen on connection property changed events:

```
MasterConnection appcon = new MasterConnection(createConnection());
appcon.addPropertyChangedListener("Application.mode", new
IConnectionPropertyChangedListener()
{
    public void propertyChanged(PropertyEvent pEvent)
    {
        liProps.add(pEvent.getPropertyName() + " = " +
pEvent.getNewValue());
    }
});
```

Above listener will be invoked whenever the connection property **Application.mode** will be changed.

It's also possible to listen on all properties, with following snippet:

```
MasterConnection appcon = new MasterConnection(createConnection());
appcon.addPropertyChangedListener(null, new
IConnectionPropertyChangedListener()
{
    public void propertyChanged(PropertyEvent pEvent)
    {
        liProps.add(pEvent.getPropertyName() + " = " +
pEvent.getNewValue());
    }
});
```

Test UI with simple JUnit Test

Sometimes you want a JUnit test case for a specific UI feature. If you need an application frame for your test, you could use following implementation:

A simple Test Launcher:

SimpleTestLauncher.java

```
/*
 * Copyright 2016 SIB Visions GmbH
 *
 * Licensed under the Apache License, Version 2.0 (the "License"); you
may not
 * use this file except in compliance with the License. You may obtain
a copy of
 * the License at
 *
 * http://www.apache.org/licenses/LICENSE-2.0
 *
 * Unless required by applicable law or agreed to in writing, software
 * distributed under the License is distributed on an "AS IS" BASIS,
WITHOUT
 * WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied. See
the
 * License for the specific language governing permissions and
limitations under
 * the License.
 *
 *
 * History
 *
 * 11.08.2016 - [JR] - creation
 */
package javax.rad.application;

import javax.rad.ui.IComponent;
import javax.rad.ui.container.IDesktopPanel;
```

```
import javax.rad.util.IRunnable;
import javax.swing.JComponent;
import javax.swing.SwingUtilities;

import com.sibvisions.rad.application.Application;
import com.sibvisions.rad.ui.swing.impl.SwingApplication;

/**
 * The <code>SimpleTestLauncher</code> starts a {@link
SwingApplication} and shows
 * a specific content in the application pane.
 *
 * @author René Jahn
 */
public class SimpleTestLauncher
{
    //~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
    // Initialization
    //~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

    /**
     * Creates a new instance of <code>SimpleTestLauncher</code>.
     *
     * @param pComponent the component to show
     */
    public SimpleTestLauncher(final IComponent pComponent)
    {
        final SwingApplication app = new SwingApplication();

        app.startup(SimpleTestApplication.class.getName(), null, null);
        app.setSystemExitOnDispose(false);
        app.eventWindowClosed().addListener(new IRunnable()
        {
            public void run()
            {
                synchronized (SimpleTestLauncher.this)
                {
                    SimpleTestLauncher.this.notify();
                }
            }
        });

        SwingUtilities.invokeLater(new Runnable()
        {
            public void run()
            {
                IDesktopPanel desktop =
((Application)app.getApplication()).getDesktopPane();
                desktop.removeAll();
                desktop.add(pComponent);
```

```
                //because test was created before LaF was set!
SwingUtilities.updateComponentTreeUI((JComponent)pComponent.getResource
());
            }
        });

        synchronized(this)
        {
            try
            {
                wait();
            }
            catch (InterruptedException ie)
            {
                //ignore
            }
        }
    }

}   // SimpleTestLauncher
```

This class wrapps application creation, because we need to set the UI component after the application was started!

The second class is our Application:

SimpleTestApplication.java

```
/*
 * Copyright 2016 SIB Visions GmbH
 *
 * Licensed under the Apache License, Version 2.0 (the "License"); you
may not
 * use this file except in compliance with the License. You may obtain
a copy of
 * the License at
 *
 * http://www.apache.org/licenses/LICENSE-2.0
 *
 * Unless required by applicable law or agreed to in writing, software
 * distributed under the License is distributed on an "AS IS" BASIS,
WITHOUT
 * WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied. See
the
 * License for the specific language governing permissions and
limitations under
 * the License.
 *
 *
 * History
```

```
 *
 * 11.08.2016 - [JR] - creation
 */
package javax.rad.application;

import javax.rad.application.genui.UILauncher;
import javax.rad.remote.IConnection;

import com.sibvisions.rad.application.Application;

/**
 * The <code>SimpleTestApplication</code> is an always connected
application
 * implementation, for test cases.
 *
 * @author René Jahn
 */
public class SimpleTestApplication extends Application
{
    //~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
    // Initialization
    //~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

    /**
     * Creates a new instance of <code>SimpleTestApplication</code>.
     *
     * @param pLauncher the launcher
     */
    public SimpleTestApplication(UILauncher pLauncher)
    {
        super(pLauncher);
    }

    //~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
    // Overwritten methods
    //~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

    @Override
    protected String getApplicationName()
    {
        return "Test Application";
    }

    @Override
    protected IConnection createConnection() throws Exception
    {
        return null;
    }

    @Override
    public void notifyVisible()
```

```
    {
    }

    @Override
    protected void afterLogin()
    {
    }

}   // SimpleTestApplication
```

The application removes login screen and you can use it without manual tasks.

Finally, our JUnit test case:

TestActivity.java

```
/*
 * Copyright 2016 SIB Visions GmbH
 *
 * Licensed under the Apache License, Version 2.0 (the "License"); you
may not
 * use this file except in compliance with the License. You may obtain
a copy of
 * the License at
 *
 * http://www.apache.org/licenses/LICENSE-2.0
 *
 * Unless required by applicable law or agreed to in writing, software
 * distributed under the License is distributed on an "AS IS" BASIS,
WITHOUT
 * WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied. See
the
 * License for the specific language governing permissions and
limitations under
 * the License.
 *
 *
 * History
 *
 * 11.08.2016 - [JR] - creation
 */
package com.sibvisions.forum;

Authentication/User logging

Some applications need detailed information about successful or failed user logins. If you have such requirement, you could create a custom security manager to solve the problem. The security manager will be used for user authentication, so it's the right place to start.

We use the database security manager as base class:

LoggingSecurityManager.java

```
package com.sibvisions.apps.vaadin.web;

public class LoggingSecurityManager extends DBSecurityManager
{
    private PreparedStatement psLockedUsers;

    @Override
    protected boolean isPasswordValid(ISession pSession, String
pPassword) throws Exception
    {
        // additional check: locked user

        ResultSet resultSet = null;

        try
        {
            psLockedUsers.clearParameters();
            psLockedUsers.setString(1, pSession.getUserName());
            psLockedUsers.execute();

            resultSet = psLockedUsers.getResultSet();

            if (resultSet.next())
            {
                throw new SilentAbortException();
            }
        }
        finally
        {
            CommonUtil.close(resultSet);
        }

        return super.isPasswordValid(pSession, pPassword);
    }

    @Override
    public synchronized void validateAuthentication(ISession pSession)
throws Exception
    {
        String result = null;

        Throwable error = null;

        try
        {
            super.validateAuthentication(pSession);

            result = Constants.RESULT_OK;
        }
        catch (SilentAbortException sae)
        {
```

```
            result = Constants.RESULT_IGNORE;
            error = sae;

            throw sae;
        }
        catch (SecurityException se)
        {
            result = Constants.RESULT_DENIED;
            error = se;

            throw se;
        }
        catch (Exception ex)
        {
            result = Constants.RESULT_ERROR;
            error = ex;

            error(ex);

            throw ex;
        }
        finally
        {
            try
            {
                pSession.callAction("dbLog", Constants.TYPE_LOGIN,
error, result);
            }
            catch (Throwable thr)
            {
                error(thr);
            }
        }
    }

    @Override
    public synchronized void logout(ISession pSession)
    {
        String result = null;
        Throwable error = null;

        try
        {
            super.logout(pSession);

            if
(Boolean.parseBoolean((String)pSession.getProperty("userlogout")))
            {
                result = Constants.RESULT_OK;
            }
            else
```

```
            {
                result = Constants.RESULT_EXPIRED;
            }
        }
        catch (Exception ex)
        {
            result = Constants.RESULT_ERROR;
            error = ex;

            error(ex);
        }
        finally
        {
            try
            {
                pSession.callAction("dbLog", Constants.TYPE_LOGOUT,
error, result);
            }
            catch (Throwable eLog)
            {
                error(eLog);
            }
        }
    }

    @Override
    protected void initStatements(Connection pConnection) throws
Exception
    {
        super.initStatements(pConnection);

        psLockedUsers = prepareStatement(pConnection, "select * from
LOCKS where USERNAME = ?");
    }

}     // LoggingSecurityManager
```

The clue is that the log method **dbLog** was implemented in the session LCO of our application because we re-use the business logic in our security manager. Here's the missing method:

```
public void dbLog(int pAction, Throwable pError, String pStatus)
{
    ILogger log = LoggerFactory.getInstance(getClass());

    log.info("Log action ", pAction, pError, pStatus);

    try
    {
