Table of Contents

JVx uses standard JDK logging API or log4j.

If you don't use a custom logging.properties file, the log mechanism won't work as expected because of standard log settings of JRE/JDK:

The default logging.properties file sets the global level to:

```
.level= INFO
```

and also the console log handler level, to:

```
java.util.logging.ConsoleHandler.level = INFO
```

f you change the log level of a logger (via About screen), it wouldn't change the log output because JVx doesn't recognize the log handler configuration.

It's best if you use a preconfigured file for your application: logging.properties

Simply copy the file in your test folder or any other folder in your classpath.

The example file sets the console log handler level to

```
java.util.logging.ConsoleHandler.level = ALL
```
