Table of Contents

If you want to know the current username in your application, simply call:

```
getApplication().getUserName();
```

The method returns the same as:

```
getApplication().getConnection().getUserName();
```

If *getApplication()* return type is an *IApplication*, use this:

```
((ProjX)getApplication()).getUserName();
```

The above code is client-side code. If you need the username server side, simply call:

```
SessionContext.getCurrentSession().getUserName();
```
