

Sometimes it's useful to create an application without login. This kind of application is perfect for public areas or if you offer free services. It's not a problem to code such an application, but it's also possible to configure this requirement.

Simply use the `ConnectAuthenticator` in your `application.xml`:

```
<Application.authenticator>com.sibvisions.apps.auth.ConnectAuthenticator</Application.authenticator>
```

and set `NoSecurityManager` via `config.xml`:

```
<securitymanager>  
  <class>com.sibvisions.rad.server.security.NoSecurityManager</class>  
</securitymanager>
```

These two settings will change your application from a restricted to a public application without user login.
