There's already a push mechanism in JVx. Simply use this article and ignore the instructions for the listener registration because ProjX already is a listener. Simply extend ProjX:

```
public class CustomApplication extends ProjX
{
    public CustomApplication(UILauncher pLauncher) throws Throwable
    {
        super(pLauncher);
    }

    @Override
    public void callBackResult(CallBackResultEvent pEvent)
    {
        if ("RELOAD".equals(pEvent.getInstruction()))
        {
            try
            {
                reload();
            }
            catch (Throwable th)
            {
                error(th);
            }
        }
    }
}
```

Don't forget to configure your `CustomApplication` in **web.xml** and/or **mobile.xml**. Otherwise your application won't be used.
