Table of Contents

If you're creating RTF reports with RtfWorker, it's sometimes useful to directly write RTF syntax. This can be useful if you need a feature which it's not already implemented. Such a raw value can help you in that case.

Here's a short example which creates a simple checkbox with Wingdings font:

```
Bean bean = new Bean();
bean.put("CHECKBOX", new RawStringValue("{\\field{\\*\\fldinst SYMBOL 254
\\\\f \"Wingdings\" \\\\s 11}{\\fldrslt\\f10\\fs22}}"));

BeanNode node = new BeanNode(bean);

RtfWorker w = new RtfWorker();
w.loadDocument(getTemplateInputStream("rawvalues.rtf"));
w.fillInData(node);
w.saveDocument(new
FileOutputStream(getTempOutputFile("result_rawvalues.rtf")));
```

The template only contains:

```
[CHECKBOX]
```
