

Table of Contents

If you use [Swagger UI](#) for REST API documentation, it's relevant to set the correct **host** and **basePath** in the specification file. To use the current host and path, simply use the integrated filter. It will replace the **host** and **basePath** with current information:

```
<filter>
  <filter-name>RestApiFilter</filter-name>
  <filter-class>com.sibvisions.apps.server.http.RestApiFilter</filter-
class>
  <async-supported>>true</async-supported>
</filter>

<filter-mapping>
  <filter-name>RestApiFilter</filter-name>
  <url-pattern>*.json</url-pattern>
</filter-mapping>
```

The filter only supports **json** specification files.
