

Table of Contents

It's easy to globally change the background of application overview, menu or screens. Simply provide a `backgroundBuilder` in your main:

```
void main() async {
  await FlutterUI.start(
    FlutterUI(
      ...,
      backgroundBuilder: (context, type) {
        if (type == BackgroundType.WorkScreen) {
          if (IConfigService().offline.value)
            {
              //return null;
            }
        }

        return Container(
          decoration: BoxDecoration(
            color: Colors.white,
            image: DecorationImage(
              fit: BoxFit.fill,
              image:
                AssetImage('assets/images/custom_screen_background.jpg'),
            ),
          );
        },
        safeAreaColorBuilder: (context) => Colors.white,
      ),
    );
}
```

In this example, we show a background image in our screens and also show safe-areas in white.
