

Table of Contents

The standard button can be customized with styles, e.g. [Slider button](#) or [Text button](#). But there are more additional styles for a button.

Our button has a minimum size of 48×48 pixels. This is necessary for touch events because your fingers need some space for device contact. But sometimes 48×48 is too much. To style a button on your own, just use:

```
Style.addStyleNames(button, "f_small");
```

and the button size is as it is.
