Table of Contents

The standard JVx server implementation uses the classes DefaultObjectProvider and DefaultSessionManager for the object and session administration. To change the default settings, the server configuration can be modified via config.xml.

User-defined classes can be integrated using the following:

```
<server>
  ...
  ...
  <sessionmanager>com.app.server.AnotherSessionManager</sessionmanager>
  <objectprovider>com.app.server.AnotherObjectProvider</objectprovider>
<server>
```

Note

At a minimum, the object provider has to correspond to the class AbstractObjectProvider, and the session manager has to correspond to the class DefaultSessionManager.
