2025/09/07 13:54 1/1 Using XmlSecurityManager

If you're using a DBSecurityManager, you know that it authenticates users against a database. In some cases, you don't have a database, and you must authenticate with a XML file or a third-party product.

If you want to authenticate with an XML file, it's quite simple because JVx has a standard implementation for this case. It's very easy to configure a XmlSecurityManager:

Add the following to your config.xml:

```
<securitymanager>
     <class>com.sibvisions.rad.server.security.XmlSecurityManager</class>
     <userfile>users.xml</userfile>
</securitymanager>
```

Your users.xml should be stored in the same directory as your config.xml. Alternatively, you could define the full qualified path. The user file should contain the list of valid users:

users.xml

With the above configuration, an application user will be authenticated against an XML file.
