

Table of Contents

The startup requires specific [properties](#). Sometimes it's nice to override specific properties and use different values. This case is possible with URL parameters. We support following overrides:

```
appName  
baseUrl  
userName  
password  
layout (values: standard, corporation)  
language  
timeZone  
deviceMode  
colorScheme  
theme  
transferType (values: partial or full)  
requestTimeout,  
aliveInterval  
wsPingInterval  
debug (values: true or false)
```

The debug parameter can be used to show resource loading information on loading screen. This is useful if loading stucks.
