

# Table of Contents

If you start your own Java function or a Lifecycle Object Action, you can also print messages to your job log. Simply add following code in your function:

```
JobContext.log("Start to read stream");
```

If you run your function not as Job via Scheduler, your message will be shown via `System.out` in your console output.

An example job:

will show following log message:

```
Successful  
Start to read stream  
Read stream after 10000millis
```
