

# Table of Contents

The following XML is a minimalist deployment descriptor for applications using Vaadin UI.

#### web.xml

```
<?xml version="1.0" encoding="UTF-8"?>

<web-app id="WebApp_ID"
  version="2.4"
  xmlns="http://java.sun.com/xml/ns/j2ee"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://java.sun.com/xml/ns/j2ee
http://java.sun.com/xml/ns/j2ee/web-app_2_4.xsd">
  <!--
  ****
  Context configuration
  ****
  -->

  <display-name>Simple Application</display-name>

  <welcome-file-list>
    <welcome-file>index.html</welcome-file>
    <welcome-file>index.jsp</welcome-file>
  </welcome-file-list>

  <context-param>
    <description>Vaadin production mode</description>
    <param-name>productionMode</param-name>
    <param-value>true</param-value>
  </context-param>

  <!--
  ****
  WebUI configuration
  ****
  -->

  <servlet>
    <servlet-name>VaadinUI</servlet-name>
    <servlet-
class>com.sibvisions.rad.ui.vaadin.server.VaadinServlet</servlet-class>
    <init-param>
      <param-name>UI</param-name>
      <param-value>com.sibvisions.rad.ui.vaadin.impl.VaadinUI</param-
value>
    </init-param>
    <init-param>
```

```

        <param-name>widgetset</param-name>
        <param-
value>com.sibvisions.rad.ui.vaadin.ext.ui.Widgetset</param-value>
        </init-param>
        <init-param>
        <param-name>main</param-name>
        <param-
value>com.sibvisions.apps.simpleapp.SimpleApplication</param-value>
        </init-param>
        <init-param>
        <param-name>config</param-name>
        <param-
value>/com/sibvisions/apps/simpleapp/application.xml</param-value>
        </init-param>
    </servlet>

    <servlet-mapping>
        <servlet-name>VaadinUI</servlet-name>
        <url-pattern>/ui/*</url-pattern>
    </servlet-mapping>

    <servlet-mapping>
        <servlet-name>VaadinUI</servlet-name>
        <url-pattern>/VAADIN/*</url-pattern>
    </servlet-mapping>

```

The application will be available via <http://localhost/simpleapp/ui/>.

If your Vaadin application should be available in context-root (<http://localhost/simpleapp/>), simply change the servlet mapping to:

```

<servlet-mapping>
    <servlet-name>VaadinUI</servlet-name>
    <url-pattern>/*</url-pattern>
</servlet-mapping>
<!--
<servlet-mapping>
    <servlet-name>VaadinUI</servlet-name>
    <url-pattern>/VAADIN/*</url-pattern>
</servlet-mapping>
-->

```

## Additional Options

There are some useful options that can be controlled via init parameters:

Push support (needs an application server with push support)

```
<servlet>
```

```
<servlet-name>VaadinUI</servlet-name>
<servlet-
class>com.sibvisions.rad.ui.vaadin.server.VaadinServlet</servlet-class>

...

<init-param>
  <param-name>pushmode</param-name>
  <param-value>automatic | manual</param-value>
</init-param>
<init-param>
  <param-name>mobileView</param-name>
  <param-value>true | false</param-value>
</init-param>

<async-supported>true</async-supported>
</servlet>
```

Scale UI on mobile devices. This parameter adds `<meta name="viewport" content="user-scalable=no,initial-scale=1.0" />` to the default index.html page, rendered from Vaadin.

```
<init-param>
  <param-name>mobileView</param-name>
  <param-value>true | false</param-value>
</init-param>
```

Use an external/additional CSS file. This is useful to override default CSS definitions without modifying the original Vaadin UI CSS file.

```
<init-param>
  <param-name>externalCss</param-name>
  <param-value>../simpleapp.css</param-value>
</init-param>
```

It's also possible to use resources from jar archives. Simply add: **jar!** as prefix.

If you want to use the same UI after pressing reload in your web browser, simply set the following:

```
<init-param>
  <param-name>preserveOnRefresh</param-name>
  <param-value>true | false</param-value>
</init-param>
```

UI redirection, e.g., from <http://localhost/simpleapp/> to <http://localhost/simpleapp/ui/>

```
<servlet>
  <servlet-name>UIRedirector</servlet-name>
  <servlet-
class>com.sibvisions.rad.ui.vaadin.server.UIRedirectorServlet</servlet-
class>
  <init-param>
```

```
<param-name>redirectPath</param-name>
<param-value>/ui/</param-value>
</init-param>
</servlet>

<servlet-mapping>
<servlet-name>UIRedirector</servlet-name>
<url-pattern>/index.html</url-pattern>
</servlet-mapping>
```

### Only for Portlets

Use the following parameter to decide whether Vaadin libraries should be loaded from ROOT context (shared) or from application context.

```
<init-param>
<param-name>vaadin.shared</param-name>
<param-value>true | false</param-value>
</init-param>
```

It's possible to change the static file location, e.g., if you redirect http requests via mod\_proxy or similar:

```
<init-param>
<param-name>vaadin.staticFileLocationPrefix</param-name>
<param-value>/cust</param-value>
</init-param>
```

### ProjX

We have some special features in ProjX.

Use the following parameter to change the menu position.

```
<init-param>
<param-name>Application.Menu.position</param-name>
<param-value>left | right</param-value>
</init-param>
```

It's possible to hide the whole menu or toolbar.

```
<init-param>
<param-name>Application.Menu.visible</param-name>
<param-value>true | false</param-value>
</init-param>

<init-param>
<param-name>Application.Menu.ToolBar.visible</param-name>
```

```
<param-value>true | false</param-value>  
</init-param>
```

## Hint

It's also possible to use init parameters as URL parameter, e.g.,  
<http://localhost/simpleapp/ui/?Application.Menu.position=right> .
