Table of Contents

To use google map instead of OpenSreetMap, simply add URL parameter `mapImpl=google` or set the init-param in your deployment descriptor:

```
  <init-param>
    <param-name>vaadin.component.map.google</param-name>
    <param-value>true</param-value>
  </init-param>
```

and it's also necessary to set the API key for your google account. It's possible to do this in code, in your application:

```
getFactory().setProperty("vaadin.component.map.google.key", apikey);
```

or, just use set it in your config.xml of the application:

```
<?xml version="1.0" encoding="UTF-8"?>

<application>
  ...

  <connection>
    <property
name="factory:vaadin.component.map.google.key">apikey</property>
  </connection>
</application
```

And finally, it's also possible to put the file `googlemap.properties` to your classpath. The file should look like:

googlemap.properties

```
apikey=ABC123
```
