

The workflow engine contains functions for sending emails. These functions need a valid mail server configuration in order to work properly. Simply add the mail settings to the [application configuration](#). The following settings are possible:

config.xml

```
<?xml version="1.0" encoding="UTF-8"?>

<application>

  ...

  <mail>
    <smtp>
      <host>smtp.gmail.com</host>
      <port>587</port>
      <username>user.name@gmail.com</username>
      <password>password$secret</password>
      <tlsenabled>>true</tlsenabled>
      <defaultsender>From &lt;user.name@gmail.com&gt;</defaultsender>
    </smtp>
  </mail>

</application>
```
