If you want to start a specific workflow on server side in an [action](#) of your [life-cycle object](#), it's straight forward. Simply use the workflow access object and call one method:

```
WorkflowAccess wfa = WorkflowAccess.getCurrentInstance();  
Object id = wfa.startWorkflow(workflowNameOrId);
```

Be careful if you run above code outside the life cycle scope because

```
WorkflowAccess.getCurrentInstance();
```

tries to get the workflow access object via [SessionContext](#).

If you don't run inside the life cycle scope, use

```
WorkflowAccess wfa = new WorkflowAccess();  
wfa.setDBAccess(dbAccess);
```

instead.
